

The platform includes a real-time simulation model of microgrids containing energy units such as photovoltaics, fuel cells, and energy storage, as well as electric aircraft loads.

Renewable energy and energy storage are promising parts of the solution. Hydrogen stored at airports could be useful as fuel in hybrid aircraft. The aviation sector is investigating opportunities to reduce ...

We propose an integrated electricity-thermal-hydrogen microgrid that incorporates photovoltaics, hydrogen fuel cells, and multiple energy storage systems to reduce reliance on the power grid and external ...

Explore how microgrids enhance airport energy resilience, sustainability, and efficiency, with insights on benefits, challenges, and implementation tips.

A consensus-based solution to the problem of coordinating and balancing several Energy Storage Systems (ESSs) coexisting in a generic aircraft architecture is proposed and analyzed.

From decarbonizing travel and energy production to building resilience into grid systems, microgrid adoption can help airports achieve their net zero targets while also safeguarding travelers and airlines.

This paper presents the development of an airport bipolar DC microgrid and its interconnected operations with the utility grid, electric vehicle (EV), and more electric aircraft (MEA).

Managing the energy storage systems and the flexibility in the load-side plays an important role in preserving the system's safety when facing an energy shortage.

Photovoltaic (PV) systems are pivotal in facilitating the green energy transition within the aviation sector. However, due to the inherent intermittency of PV power generation and variable electricity tariffs from the ...

For this project we're working with several advanced energy storage and system control technologies that will be applied in a novel manner for an airport. Second, we are addressing an industry learning curve for these new ...
