

The Iron Flow Battery, which has been installed on AMS" A/B apron, is set to undergo extensive testing over the next several months, supplying electric Ground Power Units (e-GPUs) with ...

With Europe's ambitious decarbonisation targets, growing momentum across its leading airports, and a strong demand for shared learning and cross-border collaboration, Amsterdam is a timely and fitting ...

If the test goes well, more batteries will come to Schiphol. Because Schiphol's goal is for all the ground equipment around the aircraft to be emission-free, and therefore electric, by 2030.

Amsterdam Schiphol Airport has introduced the Iron Flow Battery, a pioneering step in energy storage and electrification of ground equipment. This world-exclusive technology aims to ...

The large battery, recently installed on the A/B apron, offers a reliable power supply for the charging of electrical equipment and thus relieves pressure on the grid. The Iron Flow Battery will be tested ...

In a world exclusive, Schiphol is taking a major step toward energy storage and the further electrification of ground equipment with the arrival of an Iron Flow Battery at the airport.

Schiphol Airport in Amsterdam has announced that it will be testing a new "super battery" in the coming months, in order to relieve the burden on the power grid and reduce emissions produced by the airport.

Developed by US startup ESS, the device is known as an iron flow battery. The airport is currently trialling the technology to power some of its electric ground power units. These machines ...
