

What is a photovoltaic solar energy collector?

Although not strictly thermal collectors, photovoltaic (PV) panels are a significant class of solar energy collectors. They convert sunlight directly into electricity using semiconductor materials like silicon. Characteristics: Low maintenance. Long operational life. Used in domestic as well as commercial installations.

What is a photovoltaic cell?

A photovoltaic cell is the most critical part of a solar panel that allows it to convert sunlight into electricity. The two main types of solar cells are monocrystalline and polycrystalline. The "photovoltaic effect" refers to the conversion of solar energy to electrical energy.

How do solar energy collectors work?

The choice among the various solar energy collectors is determined by the specific application--residential use, industrial process, or electrical generation. The main purpose of these collectors is to collect solar radiation and either transfer it as heat or direct it through photovoltaic cells to produce power.

How does a solar PV system generate electricity?

Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created by all of the cells together adds up to enough electricity to help power your home.
