

Communication base station hybrid energy to prevent NIMBY effect

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for both ...

The communication base station hybrid system emerges as a game-changer, blending grid power with renewable sources and intelligent energy routing. But does this technological fusion truly solve the ...

Discover how hybrid energy systems, combining solar, wind, and battery storage, are transforming telecom base station power, reducing costs, and boosting sustainability.

Our findings confirm the presence of a NIMBY effect on renewables, with landscape considerations emerging as a key factor. However, targeted communication about climate benefits ...

To address this challenge, the present study develops a comprehensive mathematical modeling framework for bio-hybrid base stations powered by synthetic biology, with emphasis on ...

In this work, we propose a new hybrid energy harvesting system for a specific purpose such as powering the base stations in communication networks. The hybrid solar-RF energy system ...

The analysis results demonstrate that the proposed model can effectively reduce the power consumption of base stations while mitigating the fluctuation of the power grid load.

In this article, we propose a joint user association and SBSs configuration scheme for maximizing energy efficiency (EE) in hybrid-energy HCNs.

In this work, we analyze the energy and cost savings for a defined energy management strategy of a RE hybrid system. Our study of the relationship between cost savings and percentage of sites equipped ...

In this system, a base station (BS) with a hybrid analog-digital (HAD) architecture sends unified wireless signals to communicate with multiple information receivers (IRs), sense multiple point targets, and ...
