

# Corrosion-resistant alternatives for mobile energy storage containers in China and Europe

What is corrosion inhibitor technology?

The corrosion inhibitor molecules are adsorbed on the surface of the container to form a protective layer, which greatly reduces the corrosion rate of the container in an acidic environment. At present, corrosion inhibitor technology is also developing in the field of energy storage.

Why is corrosion resistance important for macro packaging?

For macro packaging, ensuring the corrosion resistance of packaging materials in the TES system has become its main problem, because it is not only related to the safety of food in the transportation process but also related to the long-term use and complete function of the entire energy storage system, .

Which energy storage and conversion devices are most promising?

Electrochemical energy storage and conversion (EESC) devices, including fuel cells, batteries and supercapacitors (Figure 1), are most promising for various applications, including electric/hybrid vehicles, portable electronics, and space/stationary power stations.

Can organic phase change materials corrode packaging containers?

When organic phase change materials are used as energy storage media, corrosion of packaging containers will also occur. Kahwaji et al. performed corrosion tests on six organic phase change materials, and their selected material formulations are shown in Table 9.
