

With persistent delays in grid infrastructure improvements, there is a risk that the wait for a connection will be prolonged. As a result, increasing numbers of data centers are looking for behind ...

The interconnection queue was already too long to manage, and the Inflation Reduction Act (IRA) of 2022 sparked a rush of renewable energy projects in response to the tax credits and ...

Distributed Energy Infrastructure offers three ways a battery project's commissioning can be held up - and how to avoid these delays.

National Grid ESO, Ofgem, and the Department of Energy Security and Net Zero (DESNZ) have set out to tackle the long-term delays in grid connection completion. The final recommendations and ...

The equipment needed to keep the grid running--transformers that regulate voltage, circuit breakers that protect against faults, high-voltage cables that carry power across regions, and ...

The U.S. interconnection queue has reached a critical bottleneck in 2025, with over 2.6 terawatts of generation and storage capacity actively seeking grid connection.

The delays directly exacerbate grid stress and congestion, and that has had real implications for overall grid reliability and costs, the think tank warned.

Solar, wind and battery storage projects account for 95% of active capacity in queues, with most of the remaining 5% being natural gas projects. This influx of new connections requests has ...

This report considers the economic benefits of mitigating delays in transmission and generation infrastructure, estimating potential annual savings for energy consumers and significant ...

This blog outlines the challenges driving these delays and highlights practical steps state legislators can take to accelerate network upgrade construction and ensure reliable, affordable ...
