

There are three main points that shape the base of the earthquake-resistant pipelines, including movement tolerance, absorption capability, and capacity of axial strain.

Earthquake Brace and Bolt (EBB) retrofit technique is a cost-effective and efficient way to improve the structural integrity of an existing building and make it more resistant to seismic activity.

The cost for seismic retrofit is a combination of structural and nonstructural improvement costs and may also include changes in maintenance costs (FEMA 2009; Fung et al. 2022b).
