

The 100-megawatt tower-type turbine unit for the solar thermal power station in Anduo County, Xizang Autonomous Region is loaded on truck for shipping. [Photo/sasac.gov.cn] Located in ...

The multifaceted system, where components like hydropower generation and surplus electricity storage complement each other, plays an exemplary role for the subsequent projects ...

In 2021, China's State-owned Assets Supervision and Administration Commission of the State Council (SASAC), which manages state-owned enterprises (SOEs), announced a new requirement that ...

On April 17, the 700 MW high-efficiency ultra-supercritical circulating fluidized bed (CFB) power generation unit at Yuneng Honghe Power Plant successfully completed a 168-hour trial run, marking ...

Developing supporting power grids for wind and solar power generation as well as connecting electricity produced by hydropower and nuclear power are also highlights.

The rapid development of solar PV and wind power capacity is posing new challenges to grid stability due to the intermittent nature of power supplied by these plants. For instance, the curtailment of wind ...

This project features the world's first concentrated solar power (CSP) station with a dual-tower, single turbine design. The simultaneous ignition of its two 200-meter-high receiver towers, ...

By the end of July, the total installed capacity of power generation in China was 3.67 billion kilowatts, up 18.2% year on year. Among them, the installed capacity of solar power was 1 ...

China's State-owned Assets Supervision and Administration Commission of the State Council (SASAC) has recently announced the successful inauguration of the Caipeng photovoltaic ...

Despite significant progress in solar power deployment, its penetration in the electricity mix remains relatively low. This study employs process tracing to compare solar power development in ...
