

Herein, a system is reported that is versatile, low cost, mechanically strong, and can achieve large-angle reorientation driven by unconcentrated sunlight. This system is demonstrated to ...

The capability to harness tropistic behaviour autonomously, without external instruction and power supply (for example, via electromechanically programmed systems), would enable highly efficient ...

Therefore, this study explains the structure of a solar thermal power plant with a thermal stor-age system and analyzes its main energy flow modes to establish a self-operation and low-carbon scheduling ...

This paper is aimed to resolve electricity issues of rural areas using standalone integrated system of wind turbine and solar module in cost effective and efficient way. A virtual model is built in ...

Inspired by the natural phototropic movements of sunflowers, which autonomously orient towards sunlight to optimize natural light capture and promote growth, we have modified the ...

By leveraging directional thermal flux from solar absorbers to radiative coolers, the system generated stable temperature gradient and sustained power output, enabling self-powered ...

This research proposes a novel AI-enhanced hybrid solar energy framework integrating spatio-temporal forecasting, adaptive control, and decentralized energy trading.

Herein, we demonstrate an LCE-based phototropic material system, which meets these criteria and can be applied for enhancing the light harvesting and thus the performance of various ...

A fully integrated flexible solar-thermoelectric generator is demonstrated utilizing Ag₂Se thin films as both efficient photothermal absorber and thermoelectric generators. The device delivers ...
